Summary

Extensive experience in technical professional services, at the point where deep implementation work meets direct customer engagement. The loop has always been the same: sit with a customer, understand what they actually need, find where the product falls short, then go write the missing piece. I've built data pipelines and integration systems from scratch, owned them through production at enterprise scale, and made the architectural decisions about how they grow. I'm drawn to understanding how systems work, and to making them work better.

Skills

Customer engagement: Requirements discovery · Gap analysis · Translating technical constraints into business terms · Knowing when to build vs. configure

Languages & Scripting: Python · Java · SQL · JavaScript · Unix/Shell · REST APIs

Infrastructure: Docker · Kubernetes · AWS (EC2) · Oracle Cloud Infrastructure (OCI) · Linode · Git · Jenkins · CI/CD

Technical strengths: SQL performance tuning · Data pipeline architecture · Distributed systems operations · System integration

LLM integration: Claude (Anthropic), OpenAI, multi-provider routing; RAG patterns, vector search, pgvector, semantic embeddings, Supabase

Agentic systems: LangGraph (orchestration, checkpointing, human-in-the-loop), MCP (Model Context Protocol, consuming + publishing servers); Jev (TypeSafe AI decision model)

Prompt engineering: System prompt design, context engineering, code-based validation of LLM output, evaluation, LLM cost optimization

Tooling & production: Langfuse (observability, traces, prompt versioning), n8n (workflow automation), deployment, security threat modeling

Edge & on-device AI: wake-word detection, speech-to-text, and text-to-speech on Raspberry Pi (openWakeWord, Moonshine, Piper)

Production AI Projects (2024–present)

- **Built and deployed an agentic email pipeline:** a LangGraph agent that sorts job emails with a decision model, extracts posting links with an LLM whose output is validated in code, and hands genuinely ambiguous cases to a human over Slack. Moved the sorting decision from an LLM to Jev, which cut cost per email from about $1.00 to $0.04 and processing time from minutes to seconds. Langfuse for observability, MCP servers on both ends. Wrote the threat model before any code, then built against it: prompt injection, stored XSS, and cross-tenant access each have a specific mitigation
- **Designed and built private voice assistant devices** on Raspberry Pi and ReSpeaker hardware: wake word, speech-to-text, and speech synthesis all run on the device itself, feeding a self-hosted AI agent hands-free. Each unit keeps its own memory scope and listens on no inbound ports. Brought the same design to the desktop as Agent Voice, an open-source voice interface for Omarchy: say a wake word and whichever AI agent is installed (Claude Code, Codex, Gemini) answers out loud, with all speech processing on the machine, tuned to run CPU-only on a 2014 laptop
- **Launched two production AI sites.** hire-duane.org is an interactive resume with RAG-backed chat and job-fit evaluation, built to be readable by crawling agents. job-radar.net runs on AWS and handles multi-provider job search with AI scoring, resume tailoring, application workflow, and interview prep
- **Deployed OpenBrain behind custom MCP servers:** a model-agnostic memory layer on PostgreSQL and pgvector that answers semantic queries from Claude, ChatGPT, Cursor, or any MCP client, all against one shared knowledge base
- **Automated multi-step workflows in n8n,** wiring APIs and services together with LLM-powered decision nodes

Experience

Responsys / Oracle

2007 – 2026

Principal Professional Solutions Consultant → Data Architect → Solutions Architect → Principal Applications Engineer, Operations

Owning the Platform (2013 – 2026)

- Fielded the final escalations on production data integration issues, joining customer calls as the subject matter expert and advising on how their integrations should be built. As the author of the framework, the buck stopped there: anything that could not be resolved was an infrastructure problem, not an integration one.
- Made the architectural decisions on reliability, redundancy, and capacity planning after Oracle acquired the company
- Led the migration of the whole environment from bare metal to containers on Oracle Cloud Infrastructure (OCI), using Docker, Kubernetes, Git, and Jenkins, and finished it without a significant downtime event
- Deployed the environment in new datacenters as the platform expanded

Building the Platform (2007 – 2013)

- Designed and built the company's data pipeline and integration framework from scratch. It replaced 95% of the custom scripts running in production, became the standard across professional services, and grew to carry 200+ production jobs for 80+ enterprise customers
- Owned end-to-end delivery of customer engagements: discovery, requirements gathering, documentation, implementation, custom development, and handover to support
- Trained consultants and partners on implementation best practices; primary subject matter expert for custom data integration across the organization

Notable customers: Williams Sonoma, Pottery Barn, West Elm, Epson, Orbitz, Carlson Wagonlit, Verizon, Disney, Symantec, Lenovo, Levi's, Lego, PayPal, See's, Coach, Grainger, Intuit, Wells Fargo, BabyCenter

Extensity / Geac / Infor

1999 – 2007

Principal Professional Services Consultant → Team Lead, Custom Solutions Group

- Ran enterprise software implementations start to finish, from discovery and requirements through training and support handover, for domestic and international clients
- Built multi-currency and exchange rate support from scratch, which made the company's first international enterprise deployments possible at Cisco and Sybase. The features later shipped in the core product
- Worked directly with engineering to drive bug fixes and code changes into the product codebase
- Spent 18 months in the UK as lead technical member of the founding professional services team; trained and mentored three colleagues, hands-on across all client implementations
- Turned around six at-risk implementations led by other consultants, diagnosing deployment and implementation issues and getting each customer back on track
- Led a team of professional services developers implementing custom solutions across the client base

Notable customers: Cisco Systems, Sybase, Ernst & Young, A.T. Kearney, State of Alaska, Franklin Investments, Lawrence Livermore National Labs, Memorial Sloan Kettering Cancer Center, UCLA, McKinsey & Co.

Education

Bachelor of Arts in Computer Science · UC Berkeley
